<http://oreilly.com/catalog/9781449303433/>

CouchDB Basics

Cluster Of Unreliable Commodity Hardware

Document-oriented, schema-less

Shared nothing, horizontally scalable

Runs on the Erlang OTP platform

Peer-based, bi-directional replication

RESTful HTTP API

Queries are done against MapReduce “views”, or indexes

When You Might Consider CouchDB

You've found yourself denormalizing your SQL database for better performance.

Your domain model is a "fit" for documents (e.g. a CMS).

Your application is read-heavy.

You need a high level of concurrency and can give up consistency in exchange.

You need horizontal scalability.

You want your database to be able to run anywhere, even on mobile devices, and even when disconnected from the cluster.

Trade-Offs

No ad hoc queries. You need to know what you're going to want to query ahead of time. For example, SQL would be a better fit for business intelligence reporting.

No concept of "joins". You *can* relate data, but watch out for consistency issues.

Transactions are limited to document boundaries.

CouchDB trades storage space for performance.

Other Alternatives to SQL

MongoDB

<http://www.mongodb.org/>

Redis

<http://redis.io/>

Cassandra

<http://cassandra.apache.org/>

Riak

<http://www.basho.com/>

HBase (a database for Hadoop)

<http://hbase.apache.org/>

Don't be so quick to get rid of SQL!
There are *many* problems for which an SQL database is a good fit. SQL is very powerful and flexible query language.

JSON Documents

```
{"title": "CouchDB: The Definitive Guide"}
```

JSON (JavaScript Object Notation) is a human-readable and lightweight data interchange format.

Data structures from many programming languages can be easily converted to and from JSON.

JSON Values

A JSON object is a collection of key/value pairs.

JSON values can be strings, numbers, booleans (**false** or **true**), arrays (e.g. [**"a"**, **"b"**, **"c"**]), **null**, or another JSON object.

A “Book” JSON Object

```
{  
  "_id": "978-0-596-15589-6",  
  "title": "CouchDB: The Definitive Guide",  
  "subtitle": "Time to Relax",  
  "authors": [  
    "J. Chris Anderson",  
    "Jan Lehnardt",  
    "Noah Slater"  
  ],  
  "publisher": "O'Reilly Media",  
  "released": "2010-01-19",  
  "pages": 272  
}
```

RESTful HTTP API

```
curl -iX PUT http://localhost:5984/mydb
```

Representational State Transfer (REST)
is a software architecture style that
describes distributed hypermedia
systems such as the World Wide Web.

**HTTP is distributed,
scalable, and cacheable.**

Everyone speaks HTTP.

Create a Database

```
$ curl -iX PUT http://localhost:5984/mydb
```

```
HTTP/1.1 201 Created
```

```
Location: http://localhost:5984/mydb
```

```
{"ok":true}
```

Create a Document

```
$ curl -iX POST http://localhost:5984/mydb  
-H "Content-Type: application/json"  
-d '{"_id": "42621b2516001626"}'
```

HTTP/1.1 201 Created

Location: http://localhost:5984/mydb/42621b2516001626

```
{  
  "ok": true,  
  "id": "42621b2516001626",  
  "rev": "1-967a00dff5e02add41819138abb3284d"  
}
```

Read a Document

```
$ curl -iX GET http://localhost:5984/mydb/42621b2516001626
```

```
HTTP/1.1 200 OK
```

```
Etag: "1-967a00dff5e02add41819138abb3284d"
```

```
{  
  "_id": "42621b2516001626",  
  "_rev": "1-967a00dff5e02add41819138abb3284d"  
}
```

When updating a document, CouchDB requires the correct document revision number as part of its *Multi-Version Concurrency Control* (MVCC). This form of *optimistic concurrency* ensures that another client hasn't modified the document since it was last retrieved.

Update a Document

```
$ curl -iX PUT http://localhost:5984/mydb/42621b2516001626  
-H "Content-Type: application/json"  
-d '{  
  "_id": "42621b2516001626",  
  "_rev": "1-967a00dff5e02add41819138abb3284d",  
  "title": "CouchDB: The Definitive Guide"  
}'
```

HTTP/1.1 201 Created

```
{  
  "ok": true,  
  "id": "42621b2516001626",  
  "rev": "2-bbd27429fd1a0daa2b946cbacb22dc3e"  
}
```

Conditional GET

```
$ curl -iX GET http://localhost:5984/mydb/42621b2516001626  
-H 'If-None-Match: "2-bbd27429fd1a0daa2b946cbacb22dc3e"'
```

HTTP/1.1 304 Not Modified

Etag: "2-bbd27429fd1a0daa2b946cbacb22dc3e"

Content-Length: 0

Delete a Document

```
$ curl -iX DELETE http://localhost:5984/mydb/42621b2516001626  
-H 'If-Match: "2-bbd27429fd1a0daa2b946cbacb22dc3e"'
```

```
HTTP/1.1 200 OK
```

```
{  
  "ok":true,  
  "id":"42621b2516001626",  
  "rev":"3-29d2ef6e0d3558a3547a92dac51f3231"  
}
```

Read a Deleted Document

```
$ curl -iX GET http://localhost:5984/mydb/42621b2516001626
```

```
HTTP/1.1 404 Object Not Found
```

```
{  
  "error": "not_found",  
  "reason": "deleted"  
}
```

Read a Deleted Document

```
$ curl -iX GET http://localhost:5984/mydb/42621b2516001626  
?rev=3-29d2ef6e0d3558a3547a92dac51f3231
```

```
HTTP/1.1 200 OK
```

```
Etag: "3-29d2ef6e0d3558a3547a92dac51f3231"
```

```
{  
  "_id": "42621b2516001626",  
  "_rev": "3-29d2ef6e0d3558a3547a92dac51f3231",  
  "_deleted": true  
}
```

Fetch Revisions

```
$ curl -iX GET http://localhost:5984/mydb/42621b2516001626  
?rev=3-29d2ef6e0d3558a3547a92dac51f3231\&revs=true
```

HTTP/1.1 200 OK

```
{  
  // ...  
  "_revisions":{  
    "start":3,  
    "ids":[  
      "29d2ef6e0d3558a3547a92dac51f3231",  
      "bbd27429fd1a0daa2b946cbacb22dc3e",  
      "967a00dff5e02add41819138abb3284d"  
    ]  
  }  
}
```

**Do not rely on older revisions.
Revisions are used for concurrency
control and for replication. Old
revisions are removed during database
compaction.**

MapReduce Views

```
function(doc) { if (doc.title) { emit(doc.title); } }
```

MapReduce consists of *Map* and *Reduce* steps which can be distributed in a way that takes advantage of the multiple processor cores found in modern hardware.

Map and Reduce are written as JavaScript functions that are defined within *views*. *Temporary views* can be used during development but should be saved permanently to *design documents* for production. Temporary views can be very slow.

Map

Add the First Document

```
{  
  "_id": "978-0-596-15589-6",  
  "title": "CouchDB: The Definitive Guide",  
  "subtitle": "Time to Relax",  
  "authors": [  
    "J. Chris Anderson",  
    "Jan Lehnardt",  
    "Noah Slater"  
  ],  
  "publisher": "O'Reilly Media",  
  "released": "2010-01-19",  
  "pages": 272  
}
```

One-To-One Mapping

Map Book Titles

```
function(doc) { // JSON object representing a doc to be mapped
  if (doc.title) { // make sure this doc has a title
    emit(doc.title); // emit the doc's title as the key
  }
}
```

The emit function accepts two arguments. The first is a key and the second a value. Both are optional and default to null.

"Titles" Temporary View

Overview > books

+ New Document ⓘ Security... Jump to: View: Stale views

⊗ Compact & Cleanup...
⊗ Delete Database...

▼ View Code

Map Function:	Reduce Function (optional):
<pre>function(doc) { if (doc.title) { emit(doc.title); } }</pre>	

Run Language: = Revert Save As... Save

Warning: Please note that temporary views are not suitable for use in production, as they are really slow for any database with more than a few dozen documents. You can use a temporary view to experiment with view functions, but switch to a permanent view before using them in an application.

Custom Reduce Functions

The built-in Reduce functions should serve your needs most, if not all, of the time. If you find yourself writing a custom Reduce function, then take a step back and make sure that one of the built-in Reduce functions won't serve your needs better.

Reduce Function Skeleton

```
function(keys, values, rereduce) {  
}
```

Parameters

Keys: An array of mapped key and document IDs in the form of [key,id] where id is the document ID.

Values: An array of mapped values.

Rerreduce: Whether or not the Reduce function is being called recursively on its own output.

Count Equivalent

```
function(keys, values, rereduce) {  
  if (rereduce) {  
    return sum(values);  
  } else {  
    return values.length;  
  }  
}
```

Sum Equivalent

```
function(keys, values, rereduce) {  
  return sum(values);  
}
```

MapReduce Limitations

Full-text indexing and ad hoc searching

- couchdb-lucene
<https://github.com/rnewson/couchdb-lucene>
- ElasticSearch and CouchDB
<https://github.com/elasticsearch/elasticsearch/wiki/Couchdb-integration>

Geospatial indexing and search (two dimensional)

- GeoCouch
<https://github.com/vmx/couchdb>
- Geohash (e.g. dr5rusx1qkvvr)
<http://geohash.org/>

Querying Views

You can query for all rows, a single contiguous range of rows, or even rows matching a specified key.

Add a Fourth Document

```
{  
  "_id":"978-0-596-80579-1",  
  "title":"Building iPhone Apps with HTML, CSS, and JavaScript",  
  "subtitle":"Making App Store Apps Without Objective-C or Cocoa",  
  "authors":[  
    "Jonathan Stark"

View Code

Map Function: `function(doc) {
 if (doc.released) {
 emit(doc.released.split("-"), doc.p...
 }
}`

Reduce Function (optional): `_stats`

Run Language:

Warning: Please note that temporary views are not suitable for use in production, as they are really slow for any database with more than a few dozen documents. You can use a temporary view to explore data in an application.

PHP CouchDB Extension (PECL)

http://www.topdog.za.net/php_couchdb_extension

Doctrine2 ODM

Do-It-Yourself

Zend_Http_Client + Zend_Cache

PEAR's HTTP_Client

PHP cURL

JSON maps nicely to and from PHP arrays using Zend_Json or PHP's json_functions

Scaling

Load Balancing

Send POST, PUT, and DELETE requests to a write-only master node

Setup continuous replication from the master node to multiple read-only nodes

Load balance GET, HEAD, and OPTIONS requests amongst read-only nodes

- Apache HTTP Server (mod_proxy)
- nginx
- HAProxy
- Varnish
- Squid

Clustering (Partitioning/Sharding)

Lounge

<http://tilgovi.github.com/couchdb-lounge/>

- Proxy, partitioning, and sharding

BigCouch

<https://github.com/cloudant/bigcouch>

- Clusters modeled after Amazon's Dynamo approach

Pillow

<https://github.com/khellan/Pillow>

- "...a combined router and rereducer for CouchDB."

Replication

Peer-based & bi-directional

Documents and modified fields are incrementally replicated.

All data will be *eventually consistent*.

Conflicts are flagged and can be handled by application logic.

Partial replicas can be created via JavaScript filter functions.
